

Don't miss the Fastener Fair New Product Showcase

Following its success in 2005 the New Product Showcase will again be the place to find innovative concepts and products, one of which could turn out to be your new profit opportunity for the coming year.

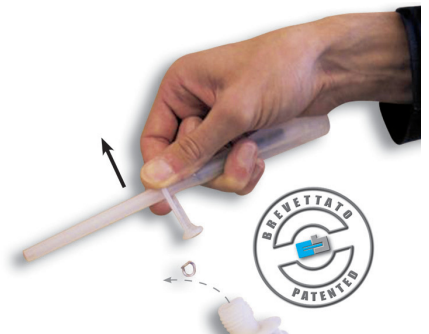

Here is a sample of just some of the innovations you will find at Stuttgart. To see them all you'll just have to be there!

Bossong introduce new opening system

Bossong has developed and patented a new opening system for its 300ml and 165ml resin cartridges. Cutting tools are not required to open the plastic foil and problems with things such as safety and dirt are solved. With this extractor system no strong pump pressure is required to open the clip and common silicon guns can be used to process the cartridge.

Bossong resins, due to strong adhesion

value and the ease of penetration into holes and hollow areas, permit secure fixing without expansion and so without stresses in the base material. Resins provide anchoring in any support materials. Heavy duty formulations for concrete (VINIL and V-LUS) are also ideal for use in hollow bricks with plastic sleeves (POLY SF and POLY) or for anchoring in historical buildings or for repairs (EPOX).

Keeping it a surprise

Deltaleigh is proving uncharacteristically coy about its entry for the New Product Showcase at Fastener Fair Stuttgart.

Using interrogation methods the CIA would never admit to, we did manage to extract a few words from Deltaleigh director, Tony Balmforth.

"Deltaleigh Ltd will be introducing an amazing and unique new UK fixing at the Stuttgart show, that's been in research and development for over 24 months. The product range will be marketed as the "Rigifix® Fixing System". It's a product that's been designed and created around solving a major application problem"

Looks like you just have to be at Stuttgart for when Deltaleigh reveals all!

Seeing is believing

Manassero & C srl has a new website, www.manassero.eu, which brings an innovative approach to assessing the suitability of used manufacturing equipment. The site uses Flash Player technology and incorporates high quality video clips of the machines in operation. "The great advantage to our customers," says Marco Manasserro, "is that before they could only see machines stored since longtime and they were always questioning if machine had been sold because it was broken or had problems. What we achieve with videos is to show machines regularly running in production and this has been greatly appreciated by our customers."

Quality control station by Eldes

At Fastener Fair, Stuttgart, Eldes will introduce a compact version of its quality station, a really mobile quality control station housing a battery operated industrial computer, with an interface instrument with up to 16 inputs for calipers, micrometers, comparators, connected to it through RS232/USB port. The quality control station will also include a container with an extractable drawer, space for accessory parts and a new edition of the SPC software, built according to the QS
